

MedTrack

Dashboard Testing Report

Final Visual, Analytical and Presentation Review

1. Purpose of the Review

This is a final review of the four MedTrack Tableau dashboards as a complete analytical product. Unlike the separate QA Checklist, this report evaluates dashboard purpose, storytelling, visual hierarchy, consistency, usability, integration and presentation readiness. It is not a second test-case checklist.

2. Review Framework

The review considers analytical purpose, visual storytelling, usability, cross-dashboard consistency and executive presentation. KPI interpretation remains based on the project-specific definitions documented in the main project documentation.

3. Dashboard Review

Dashboard	Purpose	Review Question	Content Reviewed	Assessment	Final Focus	Status
Hospital Overview	Executive snapshot of hospital-wide performance.	Does the landing page communicate hospital status quickly?	KPIs, admission/service mix, department efficiency, readmission, LOS, occupancy, bed utilization.	Strong executive entry point. Keep the KPI hierarchy dominant.	Do not add charts merely for variety.	☒ Pass
Patient Flow	Explains patient activity over time and across departments.	Can the user understand demand, discharge activity, patient volume and LOS?	Monthly admissions/discharges, patients by department, LOS, admitted-versus-refused.	Distinct operational story after the overview.	Keep admission/discharge trends prominent.	☒ Pass
Department Analytics	Compares operational performance between departments.	Can managers identify meaningful departmental differences?	Service count, efficiency, occupancy, bed utilization, readmission.	Useful comparative layer using multiple indicators.	Keep comparisons clear and avoid repetitive visuals.	☒ Pass
Resource Analysis	Explains bed capacity and resource-related performance.	Can the user connect capacity usage with departmental performance?	Bed utilization, total beds, occupancy, resource summary, occupancy versus efficiency.	Distinct resource-management perspective.	Keep occupancy and bed-utilization definitions clearly separated.	☒ Pass

4. Hospital Overview Review

The Hospital Overview is the executive entry point. Its job is to establish the hospital's overall analytical picture rather than explain every operational detail. The intended reading order is headline KPIs, major comparisons, then supporting department and capacity analysis.

Conclusion: Appropriate as the landing page and executive snapshot.

5. Patient Flow Review

Patient Flow should tell a chronological operational story. Admissions and discharges establish the trend, department volume shows where activity is concentrated, LOS adds stay-duration context, and admitted-versus-refused volume adds demand/capacity context.

Conclusion: Has a distinct role and should not duplicate the overview.

6. Department Analytics Review

Department Analytics is the comparison layer. Efficiency, occupancy, utilization, service volume and readmission should be viewed together rather than using one metric to label a department as good or poor.

Conclusion: Provides the required department-level comparison layer.

7. Resource Analysis Review

Resource Analysis concentrates on bed capacity, occupancy and utilization and connects these indicators with departmental efficiency. Occupancy and the project-specific bed-utilization indicator must remain clearly distinguished.

Conclusion: Provides a distinct resource-management perspective.

8. Cross-Dashboard Design Review

Review Area	Final Standard	Status
Visual hierarchy	KPIs establish the primary reading order, followed by decision-relevant comparisons.	☑ Pass
Canvas consistency	Same dashboard dimensions across the four dashboards.	☑ Pass
Theme consistency	Background, typography, KPI-card style and navigation remain consistent.	☑ Pass
Information density	Each dashboard contains enough analysis without unnecessary repetition.	☑ Pass
Chart diversity	Different chart forms serve different analytical questions.	☑ Pass
Filters	Filters are visible and affect intended worksheets.	☑ Pass
Tooltips	Tooltips provide exact values and useful context.	☑ Pass
Navigation	The four dashboards operate as one integrated suite.	☑ Pass
Readability	Titles, labels, numbers and legends remain readable.	☑ Pass
Executive readiness	Main operational story can be understood quickly.	☑ Pass

9. Dashboard Storyline

The four dashboards should communicate one progressive analytical story:

Hospital Overview → What is happening across the hospital?

Patient Flow → How is patient activity changing over time?

Department Analytics → Where do departments differ?

Resource Analysis → How is hospital capacity being utilized?

10. Final Review Decisions

Decision	Rationale	Status
Do not add charts merely for variety	Add a visualization only when it answers a distinct analytical question.	☒ Confirmed
Keep Hospital Overview as landing page	It provides the broadest hospital-level context.	☒ Confirmed
Keep Patient Flow focused on movement	Do not turn it into another KPI summary page.	☒ Confirmed
Keep Department Analytics comparative	Use multiple indicators to expose departmental differences.	☒ Confirmed
Keep Resource Analysis resource-focused	Center it on capacity, occupancy, utilization and efficiency relationships.	☒ Confirmed
Use common navigation	Allow direct movement among all four dashboards.	☒ Confirmed
Preserve project KPI definitions	Do not silently replace implemented formulas with generic definitions.	☒ Confirmed

11. Final Dashboard Assessment

The four dashboards form a coherent suite with differentiated analytical purposes. The main priority is not adding more visualizations, but preserving hierarchy, consistency and analytical clarity. A decision-maker should be able to move from overall hospital status to patient flow, departmental differences and resource usage without losing context.

Overall Dashboard Status: ☒ Ready for final presentation and submission
